

01 WHAT IT DOES TO A LINE

02 THE DISK BUFFER AND THE MEMORY ENVELOPE

Every output writes to this buffer first. A hiccup layer, not durability. It survives a restart of the collector and a short outage of the store. It does not survive losing the node. Those records are gone.

MEMORY ENVELOPE

Chunks in memory	64, about 128 MB
Documented worst case	307 MB
Measured, steady load	133–228 MB
Measured, sink outage	373 MB
Flush interval	1 s
